

# file management

# File Management

- File management system consists of system utility software that run as privileged applications
  - usually part of the os kernel
  - usually based on block-oriented devices (i.e. disks)

# File System Properties

- Structure
- Long-term existence
- Sharable between processes

# File Operations

- Create
- Delete
- Open
- Close
- Read
- Write

# Terms Used with Files

- Field
  - Basic element of data
  - Contains a single value
  - Characterized by its length and data type
- Record
  - Collection of related fields
  - Treated as a unit
    - Example: employee record

# Terms Used with Files

- File
  - Collection of similar records
  - Treated as a single entity
  - Have file names
  - May restrict access
- Database
  - Collection of related data
  - Relationships exist among elements

# Typical Operations

- Retrieve\_All
- Retrieve\_One
- Retrieve\_Next
- Retrieve\_Previous
- Insert\_One
- Delete\_One
- Update\_One
- Retrieve\_Few

# Objectives for a File Management System

- Meet the data management needs and requirements of the user
- Guarantee that the data in the file are valid
- Optimize performance
- Provide I/O support for a variety of storage device types

# Objectives for a File Management System

- Minimize or eliminate the potential for lost or destroyed data
- Provide a standardized set of I/O interface routines
- Provide I/O support for multiple users

# file systems need data structures

- to keep track of which blocks are allocated to a given file
- to keep track of free blocks
- to keep names, directories, access rights, etc

# Criteria for File Organization

- Short access time
  - Needed when accessing a single record
  - Not needed for batch mode
- Ease of update
  - File on CD-ROM will not be updated, so this is not a concern

# Criteria for File Organization

- Economy of storage
  - Should be minimum redundancy in the data
  - Redundancy can be used to speed access such as an index
- Simple maintenance
- Reliability

# Fixed Blocking

**Fixed Blocking**

-  Data
-  Gaps due to hardware design
-  Waste due to block fit to track size
-  Waste due to block size constraint from fixed record size
-  Waste due to record fit to block size

# Variable Blocking: Spanned

**Variable Blocking: Spanned**

# Variable Blocking Unspanned

Variable Blocking: Unspanned

# Secondary Storage Management

- Space must be allocated to files
- Must keep track of the space available for allocation
- bitmaps
- free ranges

# Preallocation

- Need the maximum size for the file at the time of creation
- Difficult to reliably estimate the maximum potential size of the file
- Tend to overestimated file size so as not to run out of space

# Methods of File Allocation

- Contiguous allocation
  - Single set of blocks is allocated to a file at the time of creation
  - Only a single entry in the file allocation table
    - Starting block and length of the file
  - External fragmentation will occur
    - best fit, first fit, nearest fit
    - Need to perform compaction

**File Allocation Table**

File Name	Start Block	Length
File A	2	3
File B	9	5
File C	18	8
File D	30	2
File E	26	3

**Figure 12.7 Contiguous File Allocation**

**File Allocation Table**

File Name	Start Block	Length
File A	0	3
File B	3	5
File C	8	8
File D	19	2
File E	16	3

**Figure 12.8 Contiguous File Allocation (After Compaction)**

# Methods of File Allocation

- Chained allocation
  - Allocation on basis of individual block
  - FAT contains a pointer to the first block
  - Each block contains a pointer to the next block in the chain
  - Only single entry in the file allocation table
    - Starting block and length of file
- No external fragmentation
- No FAT read overhead for sequential files
- No accommodation of the principle of locality

**File Allocation Table**

File Name	Start Block	Length
...	...	...
<b>File B</b>	<b>1</b>	<b>5</b>
...	...	...

**File Allocation Table**

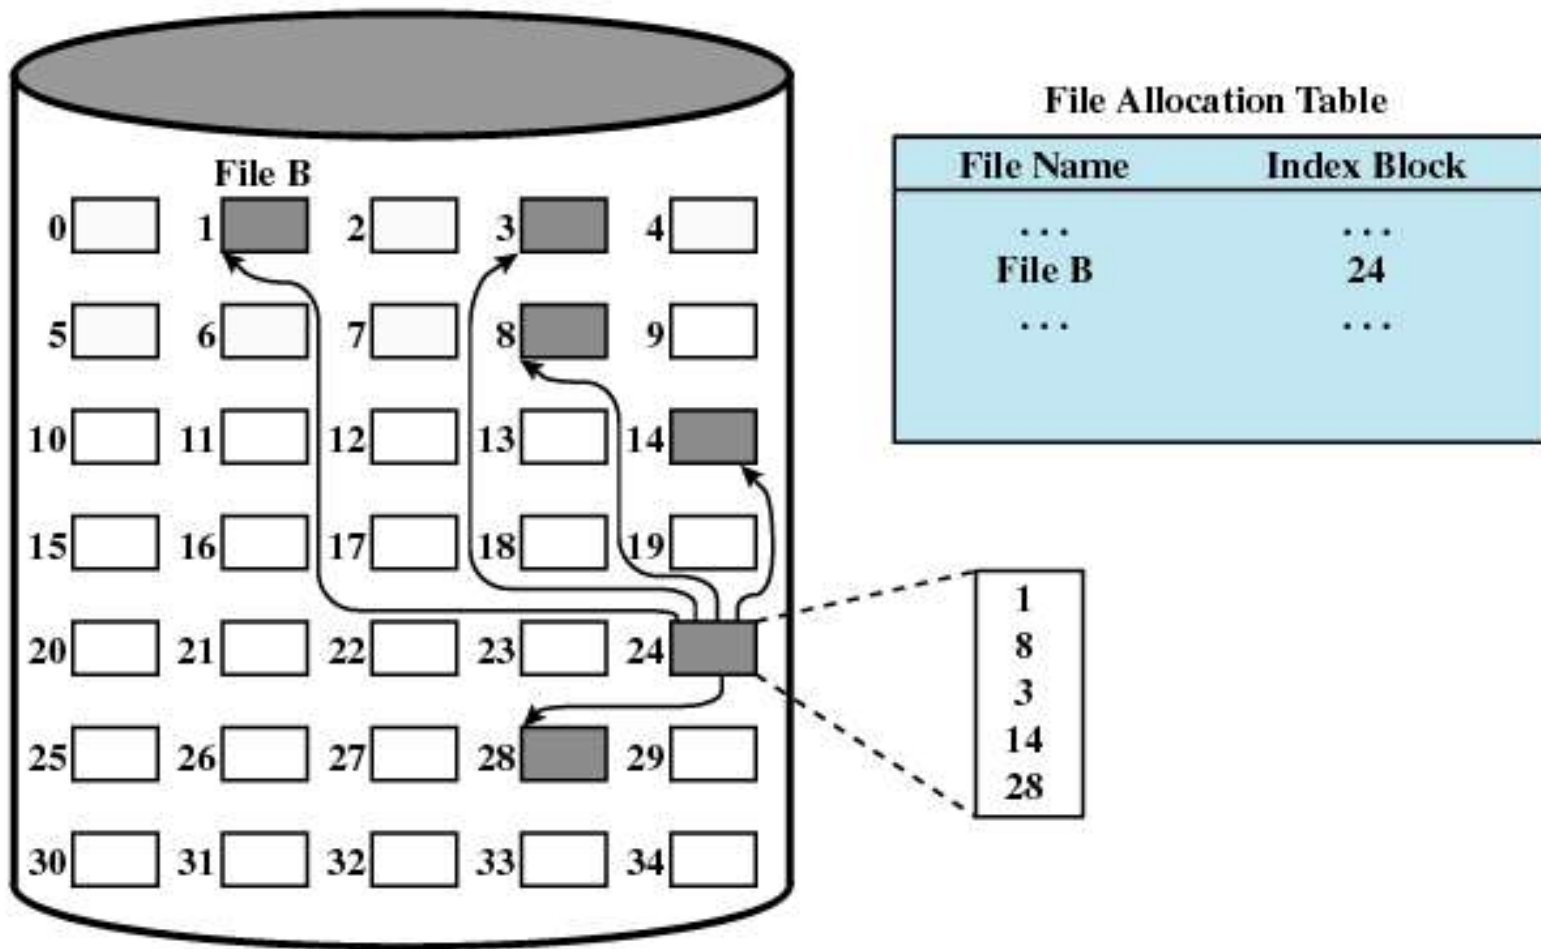

File Name	Start Block	Length
...	...	...
<b>File B</b>	<b>0</b>	<b>5</b>
...	...	...

**Figure 12.10 Chained Allocation (After Consolidation)**

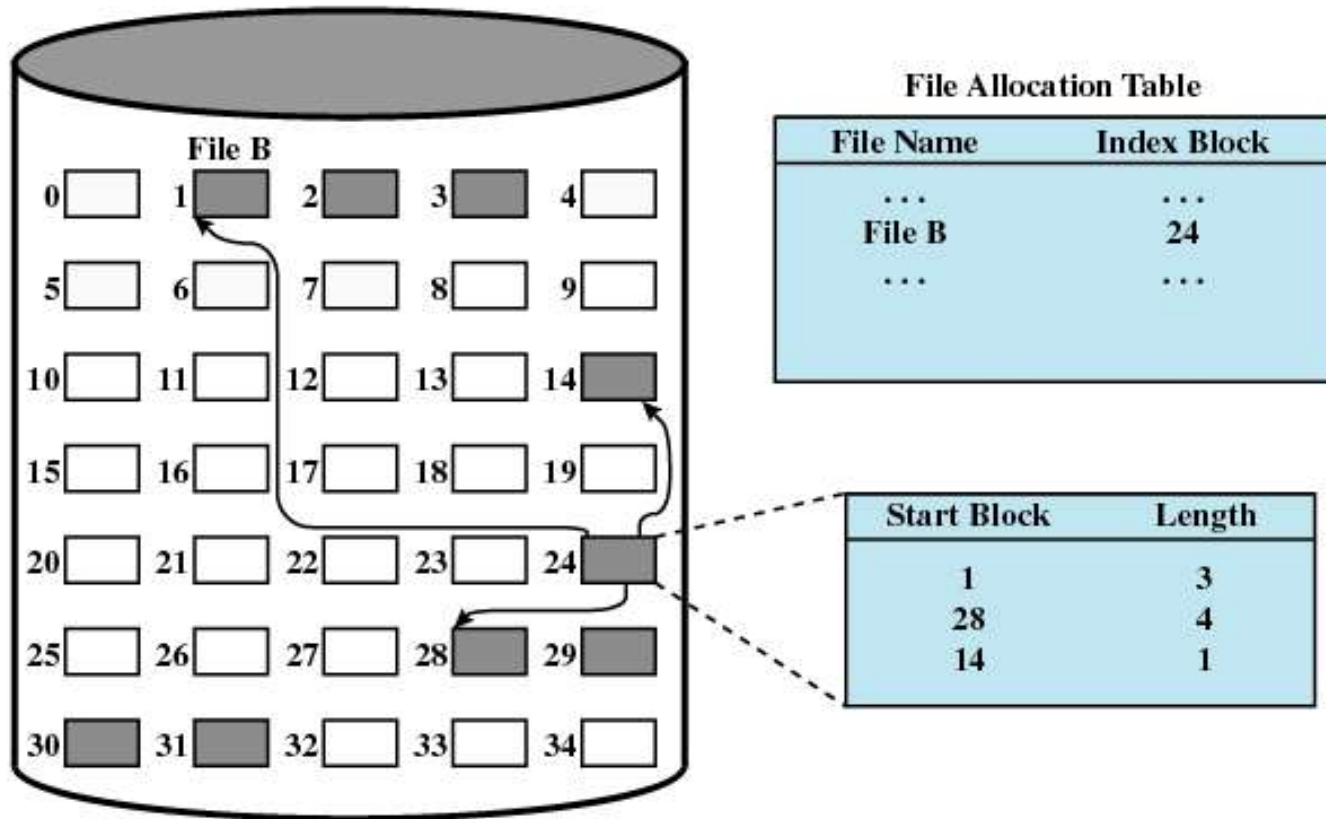

# Methods of File Allocation

- Indexed allocation
  - File allocation table contains a separate one-level index for each file
  - The index has one entry for each portion allocated to the file
  - The file allocation table contains block number for the index

**Figure 12.11 Indexed Allocation with Block Portions**

**Figure 12.12 Indexed Allocation with Variable-Length Portions**

# UNIX File Management

- Types of files
  - Regular, or ordinary
    - a sequence of bytes (no records!)
  - Directory
  - Special (character or block devices)
  - Named pipes (FIFO)
  - Links (hard links)
  - Symbolic links (soft links)

# Inodes

- Index node
- Control structure that contains key information for a particular file

<b>File Mode</b>	16-bit flag that stores access and execution permissions associated with the file.
	12-14 File type (regular, directory, character or block special, FIFO pipe)
	9-11 Execution flags
	8 Owner read permission
	7 Owner write permission
	6 Owner execute permission
	5 Group read permission
	4 Group write permission
	3 Group execute permission
	2 Other read permission
	1 Other write permission
	0 Other execute permission
<b>Link Count</b>	Number of directory references to this inode
<b>Owner ID</b>	Individual owner of file
<b>Group ID</b>	Group owner associated with this file
<b>File Size</b>	Number of bytes in file
<b>File Addresses</b>	39 bytes of address information
<b>Last Accessed</b>	Time of last file access
<b>Last Modified</b>	Time of last file modification
<b>Inode Modified</b>	Time of last inode modification

Figure 12.13 Layout of a UNIX File on Disk

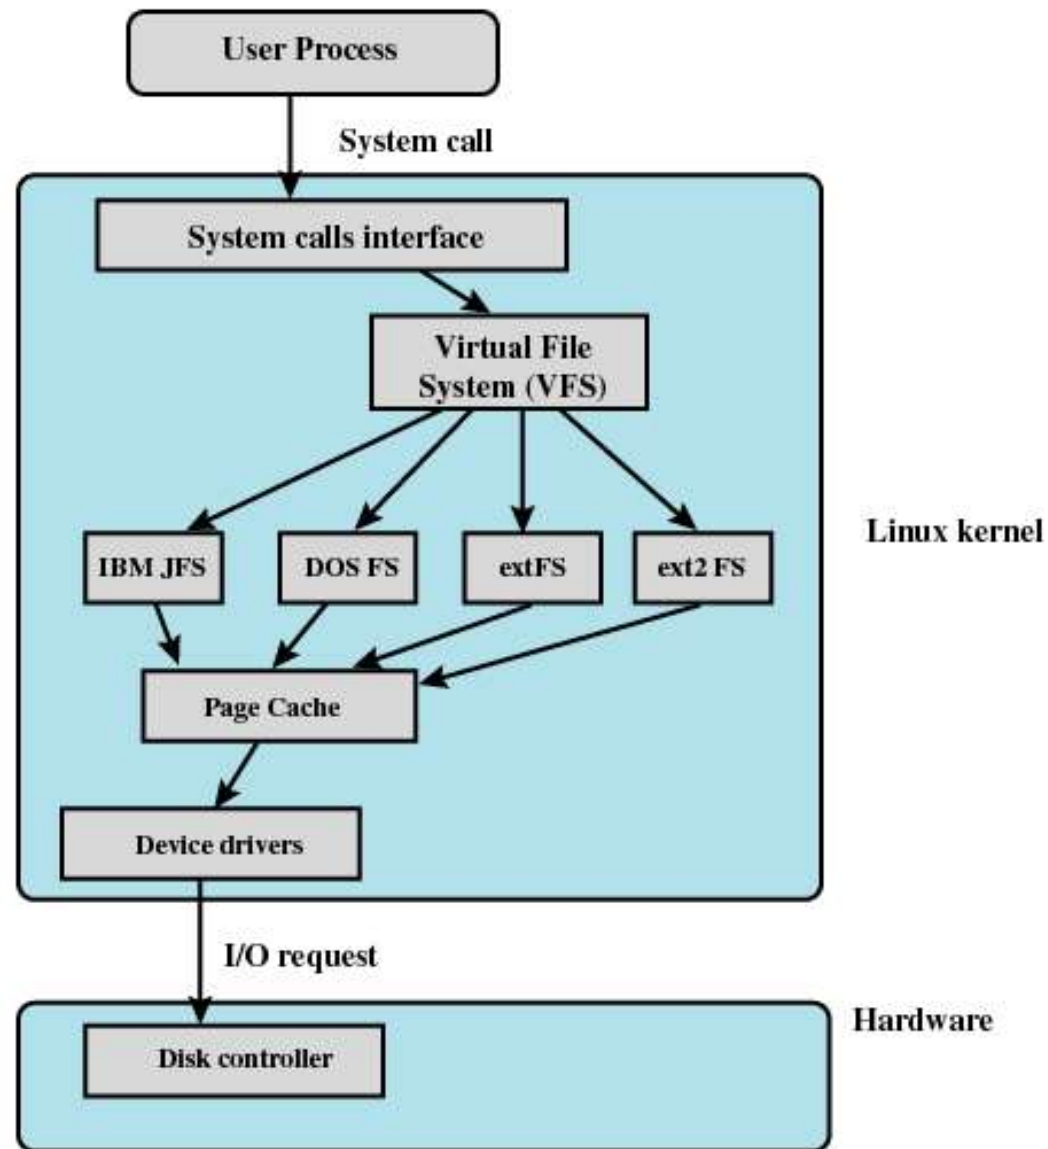

**Figure 12.14 UNIX Directories and Inodes**

# Linux Virtual File System

- Uniform file system interface to user processes
- Represents any conceivable file system's general feature and behavior
- Assumes files are objects that share basic properties regardless of the target file system

**Figure 12.15 Linux Virtual File System Context**

# Primary Objects in VFS

- Superblock object
  - Represents a specific mounted file system
- Inode object
  - Represents a specific file
- Dentry object
  - Represents a specific directory entry
- File object
  - Represents an open file associated with a process

# ext2 file system

- for each group
  - all groups are of the same length
  - each group says where all other groups are (redundancy)
  - 2 bitmaps for free/allocated spaces
    - both data blocks and inodes of this group

# ext2 file system

	inode	rec_len	file_type	name_len	name
0	21	12	1	2	. \0 \0 \0
12	22	12	2	2	. . \0 \0
24	53	16	5	2	h o m e 1 \0 \0 \0
40	67	28	3	2	u s r \0
52	0	16	7	1	o l d f i l e \0
68	34	12	4	2	s b i n

- directory stored in variable record length format
- stored as a file
- given the inode  $i$  number where is it stored on the disk?

group:  $i / \text{inodes\_in\_one\_group}$

inode:  $i \% \text{inodes\_in\_one\_group}$
